

# Isabel Longbottom

## PERSONAL DATA

---

PLACE AND DATE OF BIRTH: Perth, Western Australia | 18 May 2000  
PHONE: +61 478 042 639  
EMAIL: [helotium@gmail.com](mailto:helotium@gmail.com); [isabel.longbottom@anu.edu.au](mailto:isabel.longbottom@anu.edu.au)

## EDUCATION

---

DECEMBER 2021 Bachelor of Philosophy - Science (Honours), Mathematics major  
**The Australian National University**, Canberra  
GPA of 7.00 (out of 7.00)  
2017 Western Australian Certificate of Education  
**Rossmoyne Senior High School**, Perth  
Australian Tertiary Admission Rank of 99.95

## AWARDS AND SCHOLARSHIPS

---

2020 Hanna Neumann Prize for third year mathematics, ANU  
2020 Priscilla Fairfield Bok Prize for women in third year science courses, ANU  
2020 Invited to the IAS/PCMI Undergraduate Summer School, subsequently cancelled due to COVID-19  
2019 Hanna Neumann Prize for second year mathematics, ANU  
2019 Priscilla Fairfield Bok Prize for women in third year science courses, ANU  
2018 Hanna Neumann Prize for first year mathematics, ANU  
2018 Mavis Prater Prize for women in mathematics, ANU  
2018, 2019, 2020 Dean's Science Education Commendation  
2018, 2019, 2020 Chancellor's Letter of Commendation  
DECEMBER 2017 Beazley Medal for best overall final high school examination scores in Western Australia  
DECEMBER 2017 Subject Exhibition in Physics for highest final physics examination score in Western Australia  
DECEMBER 2017 General Exhibition  
DECEMBER 2017 DUX of Rossmoyne Senior High School  
JULY 2017 Tuckwell Scholarship for an undergraduate degree at the ANU  
2015, 2016 AND 2017 Australian Mathematics Olympiad Camp Senior  
2015-2017 Bronze (2015, 2016) and Silver (2017) awards, Australian Mathematics Olympiad

## COMPUTER SKILLS

---

Basic Knowledge: Python, Word, Excel, Macaulay2  
Intermediate Knowledge: Java, Haskell, Ada, Lean,  $\LaTeX$

## TEACHING & LEADERSHIP EXPERIENCE

---

JANUARY 2020, 2021, 2022	Tutor at THE NATIONAL MATHS SUMMER SCHOOL Guided students to explore mathematical problems and critiqued their proofs.
2020 AND 2021	Demonstrator for MATH1115, MATH1116, MATH2222, and MATH2322, ANU Ran (online and in-person) workshops, and marked assignments and exams. This position is equivalent to a TA.
DECEMBER 2020	Maths tutor for the CURIOUS MINDS STEM PROGRAM, Online Ran maths problem-solving sessions for rural female-identifying high school students.
2020	Vice President of the ANU MATHEMATICS SOCIETY
SEPTEMBER-NOVEMBER 2019	Drop-in tutor, ANU Drop-in tutor for first year courses during the exam preparation period.
2019	Peer-Assisted Learning Mentor for MATH1115 and MATH1116, ANU The Peer-Assisted Learning program at the ANU employs second-year maths students to prepare activities for and teach tutorials to first-year students.
JANUARY 2018	Experienced Group at THE NATIONAL MATHS SUMMER SCHOOL, Canberra Explored topics in cryptography, algebraic curves, and algorithms with the aim of discovering results and proofs by hand. Organised social activities for younger students.

## RESEARCH PROJECTS & SPECIAL TOPICS

Project Title	Supervisor	Description
Derived Quiver Representations	Dr Asilata Bapat	This was my Honours project. I studied the bounded derived category of quiver representations for an acyclic quiver, and gave a proof that derived reflection functors are equivalences of triangulated categories. I also looked at the iterated weight filtration, which gives a canonical refinement of the Harder-Narasimhan filtration coming from a stability condition.
Crystals: Combinatorial Algorithms and Tensor Categories	Dr Noah White	In this lecture course, we developed the theory of braided and coboundary monoidal categories, and studied the induced actions by the braid and cactus groups. We also defined reflection groups and root systems before proving the classification of irreducible finite real reflection groups. We constructed crystals of semistandard tableaux for the $(GL_n)$ root datum, and studied the RSK algorithm, Schützenberger involution and Littlewood-Richardson coefficients.
Algebraic & Analytic Number Theory	Prof. Amnon Neeman	This reading course was devoted to various topics in modern number theory. The first half proved various standard results in algebraic number theory, such as the Kummer-Dedekind theorem, Minkowski's bound and methods of computing the class group, working from Stevenhagen's <i>Number Rings</i> . We then spent some time analysing techniques specific to Galois extensions of number fields. In the second half, we transitioned into analytic number theory, proving results such as the analytic class number formula. I gave a lecture presenting the proof of the prime number theorem.
Riemann Surfaces	Dr Ian Le	This lecture course developed much of the important theory of Riemann surfaces, including the uniformization theorem, the existence of meromorphic functions on any compact Riemann surface, the classification of elliptic curves, and the Riemann-Roch formula. As a personal project, I wrote a short paper outlining the proof of Riemann-Roch for smooth 1-dimensional curves over finite fields.
Three-Manifolds	Dr Joan Licata	This course was a broad survey of topics in 3-manifold theory, including Heegaard decompositions, (Dehn) surgery, Morse theory, Kirby calculus and more. As a personal project, I gave a talk and wrote a short paper on rational tangle replacement, and the equivalence between 2-fold cyclic branched covers of $S^3$ and manifolds obtained from $S^3$ via surgery on a strongly-invertible link.
Foundations of Algebraic Geometry	Dr Anand Deopurkar	This reading course followed Ravi Vakil's <i>The Rising Sea: Foundations of Algebraic Geometry</i> to develop the theory of sheaves on schemes. The first half focused on the construction and basic properties of schemes and their morphisms, while the second half introduced quasicoherent and coherent sheaves, line bundles and sheaf cohomology.
Vector Bundles & K-Theory	Dr Vigleik Angeltveit	This course was based on Hatcher's book draft <i>Vector Bundles &amp; K-Theory</i> . It developed the theory of vector bundles on a topological space, defining topological K-theory and working through some applications. As a personal project, I studied Schubert calculus and the cohomology of Grassmannians, including the Pieri and Giambelli formulas and Littlewood-Richardson coefficients.
Computational Algebraic Geometry	Dr Martin Helmer	This course gave a computational approach to modern algebraic geometry, developing algorithms and showing their applications using the language Macaulay2. As a personal project, I studied tropical algebraic varieties from the book <i>Introduction to Tropical Geometry</i> by Maclagan and Sturmfels, building towards the Structure Theorem.
Perverse Sheaves & Deligne-Lusztig Theory	Dr Asilata Bapat & Dr Uri Onn	This formal lecture course was divided into two sections. In the perverse sheaves component, we developed the theory of derived categories and t-structures on a triangulated category. We used this to study perverse sheaves and the perverse t-structure induced by a perversity function. The Deligne-Lusztig component was devoted to various classifications for characters on finite reductive groups, including parabolic induction and Deligne-Lusztig induction.
Calculus on Manifolds	Prof. Ben Andrews	I followed the text <i>Calculus on Manifolds</i> by Michael Spivak to learn the elementary theory of differential geometry. Ben Andrews provided resources to extend the project into the topics of Riemannian metrics and de Rham Cohomology.
Combinatorial Game Theory in Lean	Prof. Scott Morrison	This project was an attempt to formalise the basic theory of Conway's combinatorial games in the interactive theorem proving language Lean. While this theory is mostly elementary, it interacted in surprising ways with the inductive type system in Lean, and the difficulty of this project lay in proving well-foundedness of the necessary recursive definitions in Lean by choosing the right data types.
